

# VP1000

## Pressure Independent Control Valve

### Product Bulletin

#### Introduction

The VP1000 Pressure Independent Control Valve is the combination of a differential pressure regulator and a regulating valve for flow adjustment.

The VP1000 valve allows the adjustment of the flow rate in case of partial load of the system and also ensures a stable adjustment of the supply connected to it. The differential pressure regulator corrects any differential pressure variation. This leads to a considerable reduction in temperature variations and adjustment movements and the extended life of moving devices connected to it.

The VP1000 valve offers complete adjustment flexibility. In combination with Johnson Controls actuators they can be set to a specific flow rate value and allow precise modulating control. The valve always guarantees a suitable flow rate, therefore avoiding high energy consumption.

Since the VP1000 valve performs the functions of two valves (balancing and adjustment), installation costs are considerably reduced. The automatic flow rate limitation eliminates system adjustment costs. Since adjustment is very easy to perform, design flow rates can be modified at any time and at low cost.

Since it is not necessary to adjust the valve after its installation, the valve can work immediately after it has been assembled, for example, on the floor where works are already finished. In order to adjust the flow rate, just set the selected value using the adjustment knob.

VP1000 Compact Axial Valve,  
VP1000 Axial Valve and VP1000 Ball Valve

Since flow rate is the only parameter to be considered, choosing a suitable valve is fast and easy. The VP1000 valve's maximum adjustment matches the maximum flow rate allowed by the pipe size, on the basis of the values established by international standards.

#### Features and benefits

- KVS calculation is not necessary
- Valve authority calculation is not required
- Specific devices or knowledge are not necessary
- Compact design that allows installation in small spaces such as fan-coils or narrow supply spaces
- Simple flow rate adjustment

# Operating principle

The VP1000 valve is comprised of three main parts:

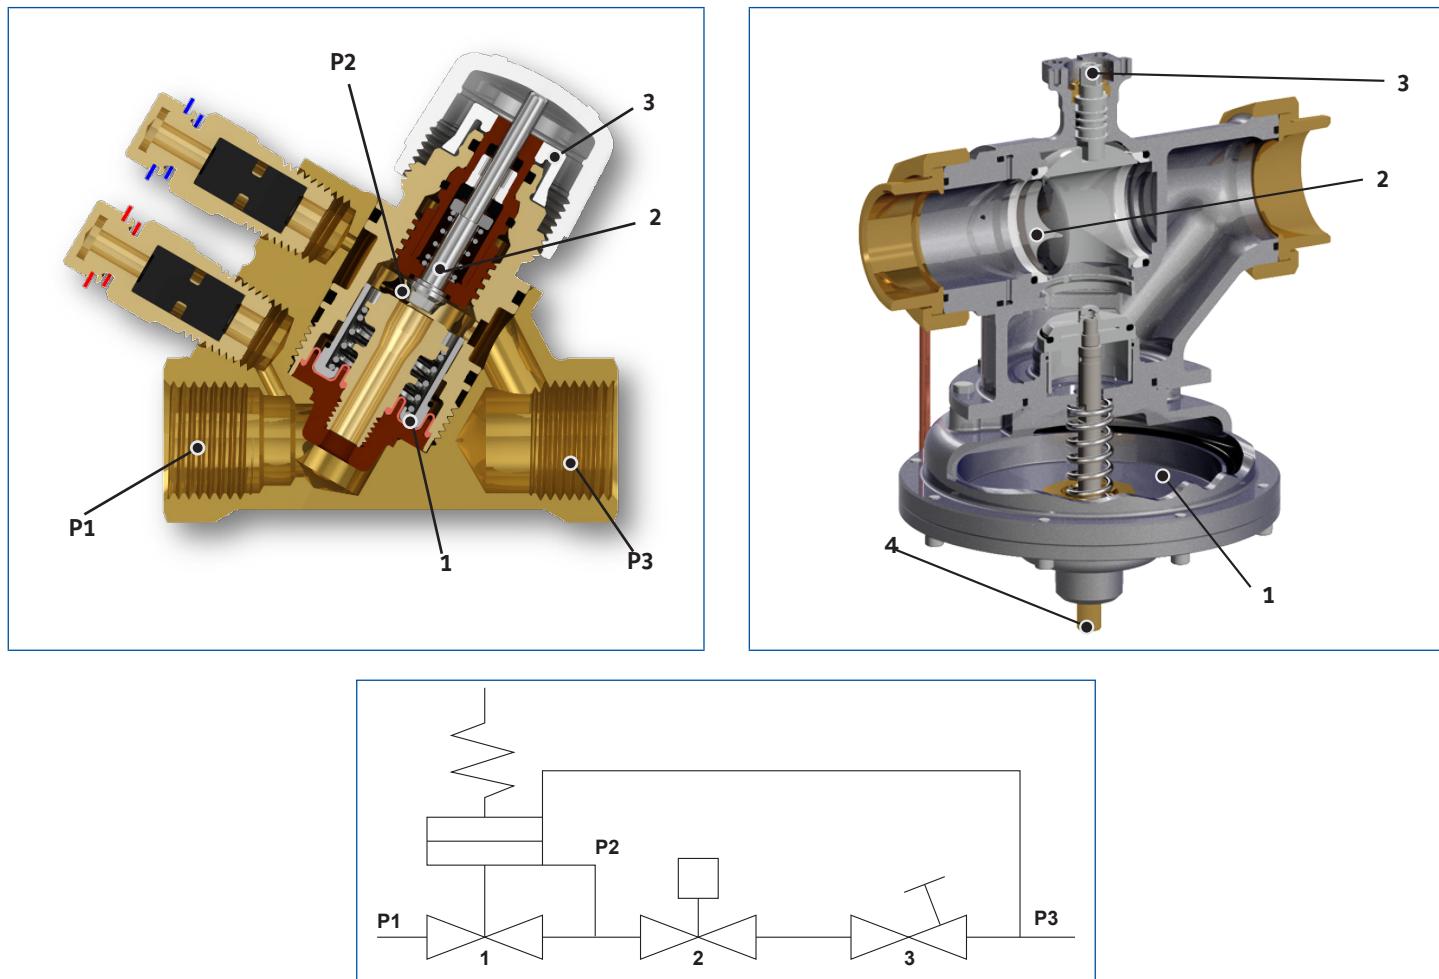

1. Differential Pressure Regulator
2. Regulating Valve for Flow Adjustment
3. Flow Adjustment Knob
4. Manual Shut Off (VP100 Ball Valve Only)

## Differential pressure regulator

The differential pressure regulator is the heart of the pressure independent control valve. By keeping a constant differential pressure across the valve seats, constant flow and full authority temperature control can be achieved.

Incoming pressure P1 is transmitted to the top face of the diaphragm, outgoing pressure P3 is transmitted to the underside of this same diaphragm. A constant effective differential pressure is maintained between P2 and P3.

The diaphragm acts against a spring in order to balance the pressure control and stop the diaphragm oscillating.

## Regulation Valve

Water flow through a valve varies as a function of the area of passage and the pressure differential across that valve. Due to the incorporation of the differential pressure regulator the differential across the valve seats P2 – P3 is constant meaning that flow is now only a function of area of passage. Setting any flow rate value and maintaining it as stable is also possible. The regulation valve presents an equal percentage characteristic. The compact version is default linear but can be set to equipercentage using an actuator.

## ■ Flow Preset

### VP1000 Axial

The maximum value of the flow can be preset, choking the outlet section of the control valve using the graduated adjustment knob. The percentage value, indicated on the scale, matches the maximum flow rate percentage.

This value can be changed turning the adjustment knob until it reaches the selected position (matching the percentage indicated on the scale). Refer to the adjustment tables on page 19.

A tightening mechanism avoids the valve set values from being changed inadvertently.

To set the selected flow, follow these steps:

Lift the lock pin to unlock the selector

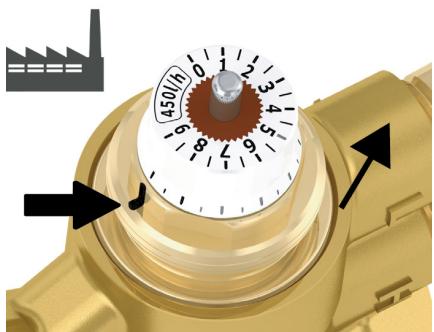

Turn the selector to the target position

Press the lock pin to lock the selector in the final position

### Compact VP1000 Axial

To adjust the maximum flow rate, refer to the adjustment tables on Page 19 to determine the preset dial value. The values on the adjustment dial indicate the setting value of the maximum flow rate. Rotate the adjustment dial to the required dial value.

Remove the handwheel or the actuator. Default setting: pos. 9

Turn the selector to the target position

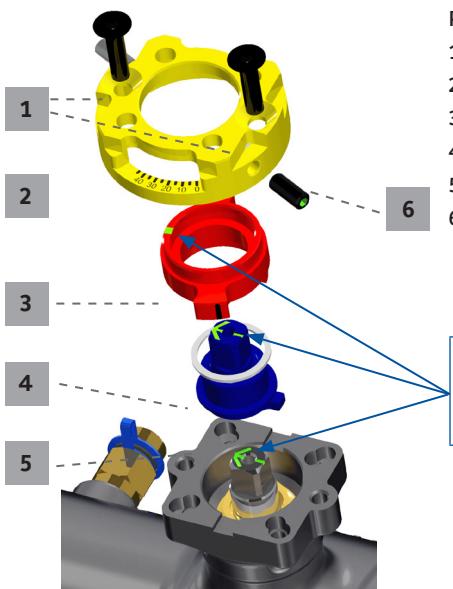

Re-assemble the handwheel or actuator

## VP1000 Ball Valves

The maximum value of the flow can be preset, choking the outlet section of the control valve, using the graduated adjustment kit. The percentage value, indicated on the scale, matches the maximum flow rate percentage.

### Pre-Setting Assembling

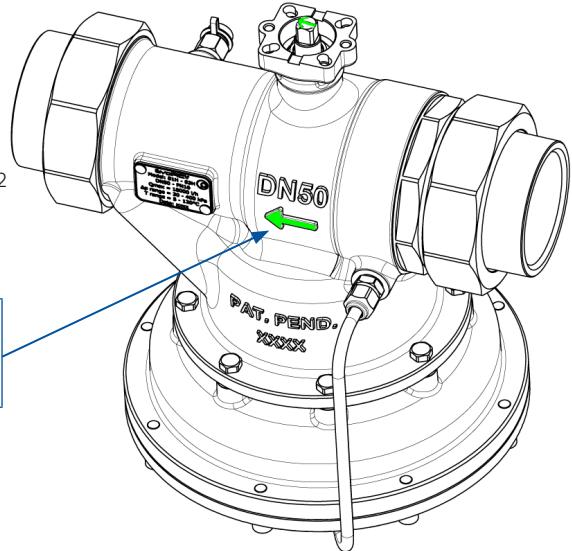

#### Pre-Setting Components

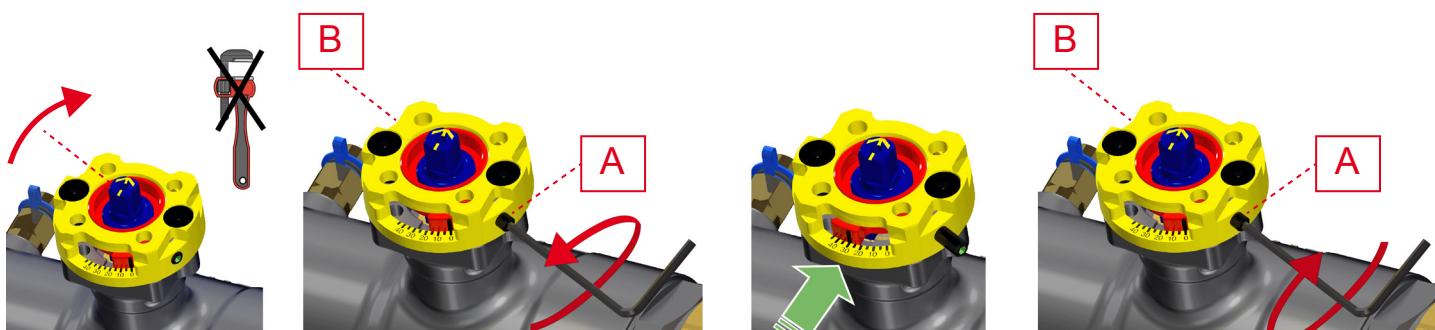

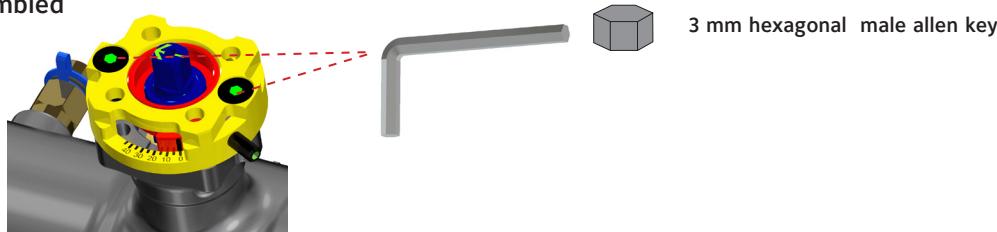

1. n° 2 countersunk head screw M5x20
2. Pre-setting body
3. Ring indicator
4. P.T.F.E. anti-friction ring
5. Control stem
6. n° 1 Hexagon socket set screw M5x12

Orientate these components with the arrow or notch in the same verse of the arrow marked on the valve body.

### Assembled

1. Close the valve, by using a 9mm wrench. In case the actuator is on, fully close the valve by using a control signal applied to the actuator or use the manual override.

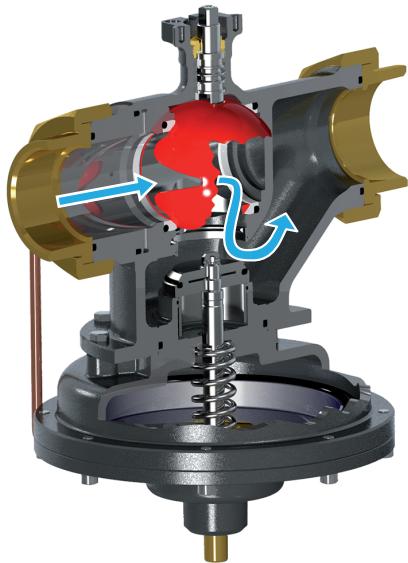

2. Release the 2 hexagon socket set the screws (A and B) of the locking device using 3mm allen key.

3. Set maximum flow rate by rotating the highlighted red ring indicator.

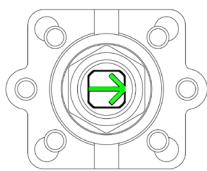

4. Lock again the 2 hexagon socket set screws (A and B) and re-open the valve. Torque 2 ÷ 3 Nm.

## ■ Flushing mode and Manual Shut Off (Ball Valves Only)

### 1. Equal Percentage Control Valve

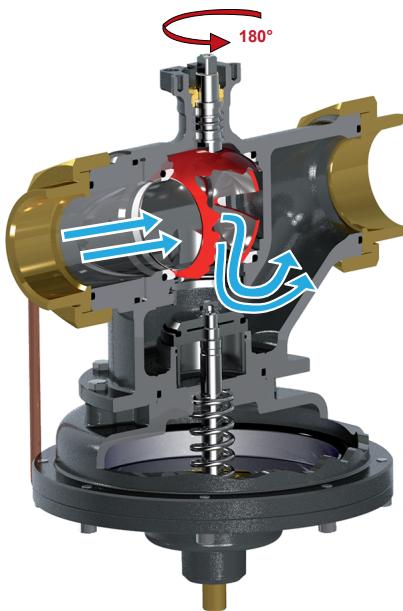

Arrow on  
Control stem square

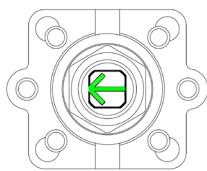

Control valve fully open,  
controlling the flow through  
profiled ball and a 90° rotating  
actuator.

### 2. Flushing Mode

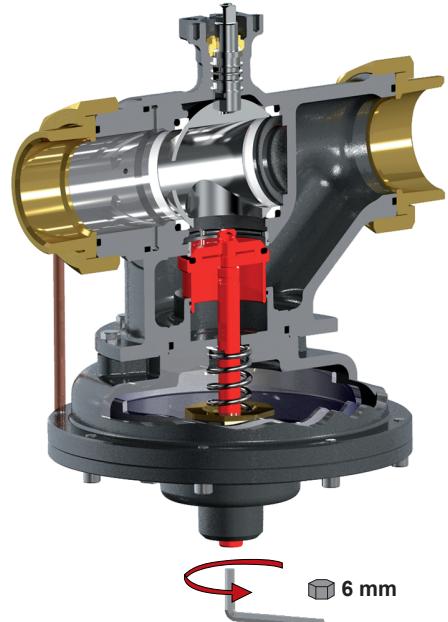

Arrow on  
Control stem square

Control valve rotated by 180°,  
profiled opening outside flow  
path. The valve has now full port  
passage, allowing twice maximum  
flow, for proper flushing and  
cleaning actuator.

### 3. Manual Shut Off Valve

It is possible to manually shut  
off the valve, by screwing the  
headwork from bottom side with an  
hexagonal male allen key.

# Installation and Maintenance

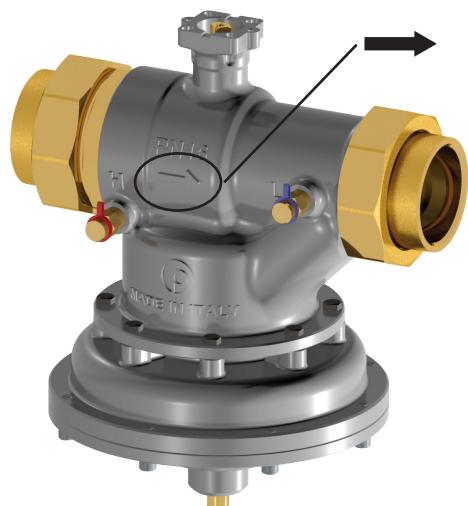

## ■ Use Conditions

The valve has to be mounted with the arrow in the direction of the flow. Mounting it in the wrong direction may damage the system and the valve itself.

If flow reversal is possible, a non-return valve should be mounted.

VP1000 Axial

VP1000 Ball Valve

VP1000 Compact Axial (DN15-DN40)

## ■ Operating Control

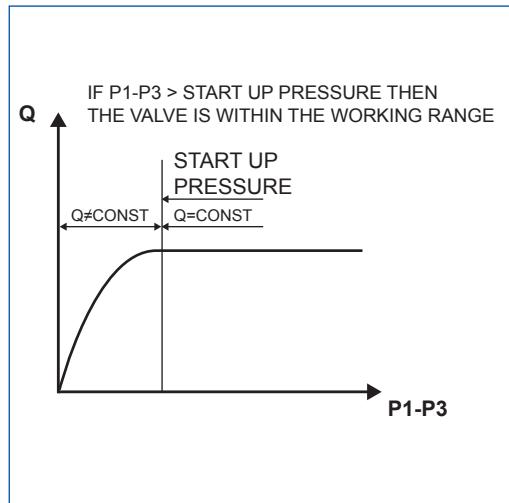

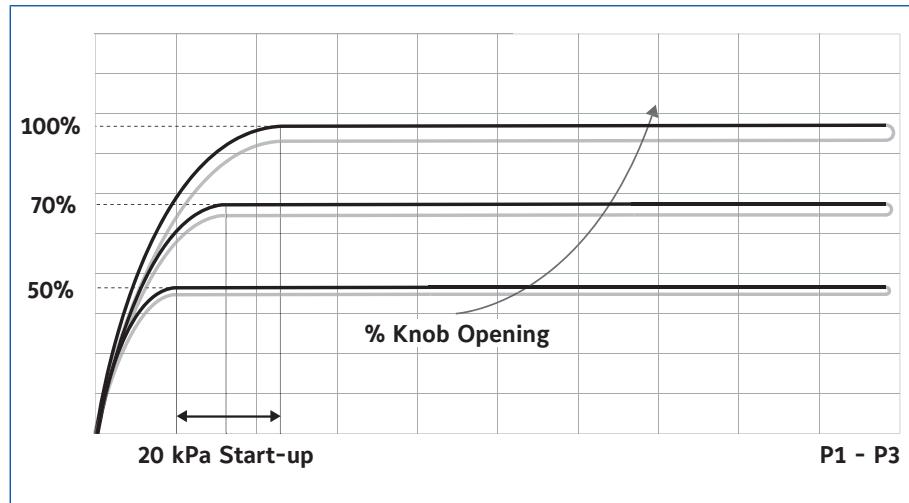

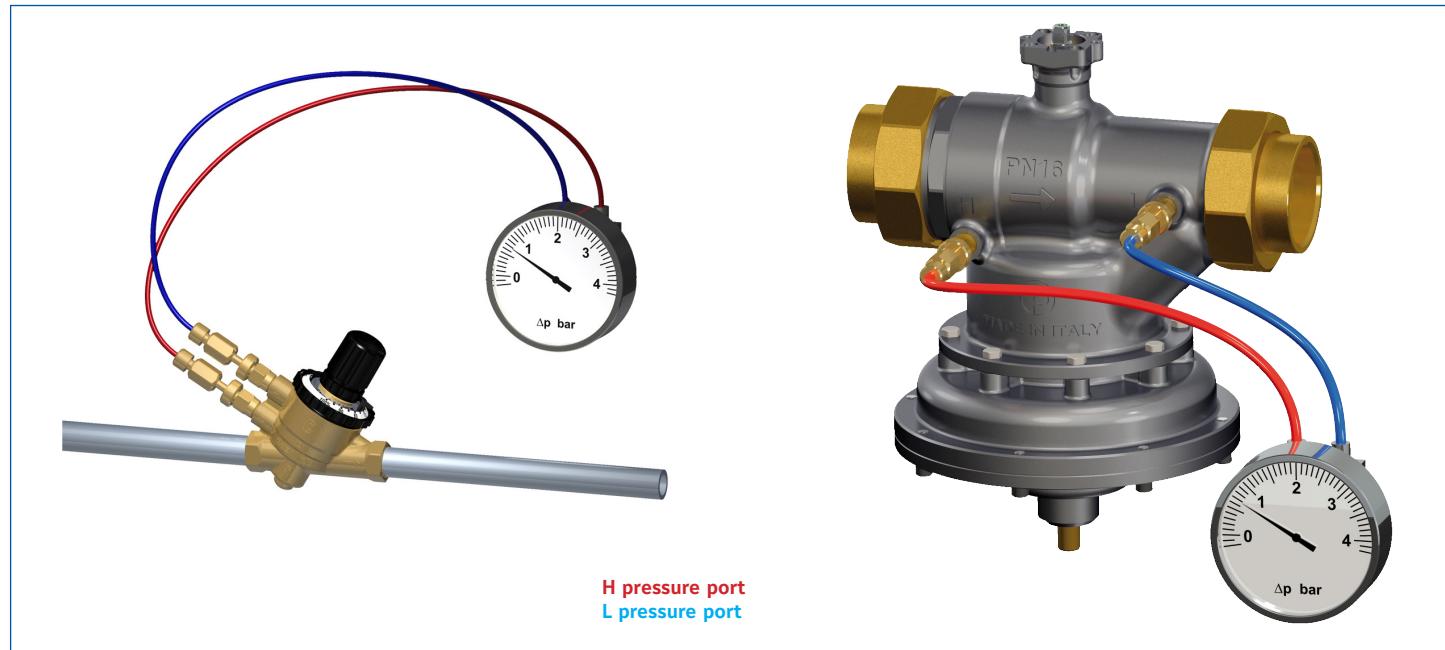

It is necessary to be sure that the valve is actually working in the operating range. In order to verify it, just measure the differential pressure across the valve, as shown in the picture.

If the measured differential pressure is higher than the start-up pressure (see Technical Specifications), the valve is actually keeping the flow stable at the set value.

### Dynamic Characteristic Curves

Using a differential pressure gauge to measure the pressure drop the valve absorbs, allows to check whether the valve is in the operating range (and, therefore, whether there actually is a flow control) by simply verifying that the measured value P1 - P3 is higher than the start-up value.

If the  $\Delta P$  measured value is lower than the start-up value, then the valve works as a fixed orifice valve.

## ■ Maintenance and Cleaning

During valve cleaning operations, use a damp cloth. DO NOT use any detergent or chemical product that may seriously damage or compromise the proper functioning and the reliability of the valve.

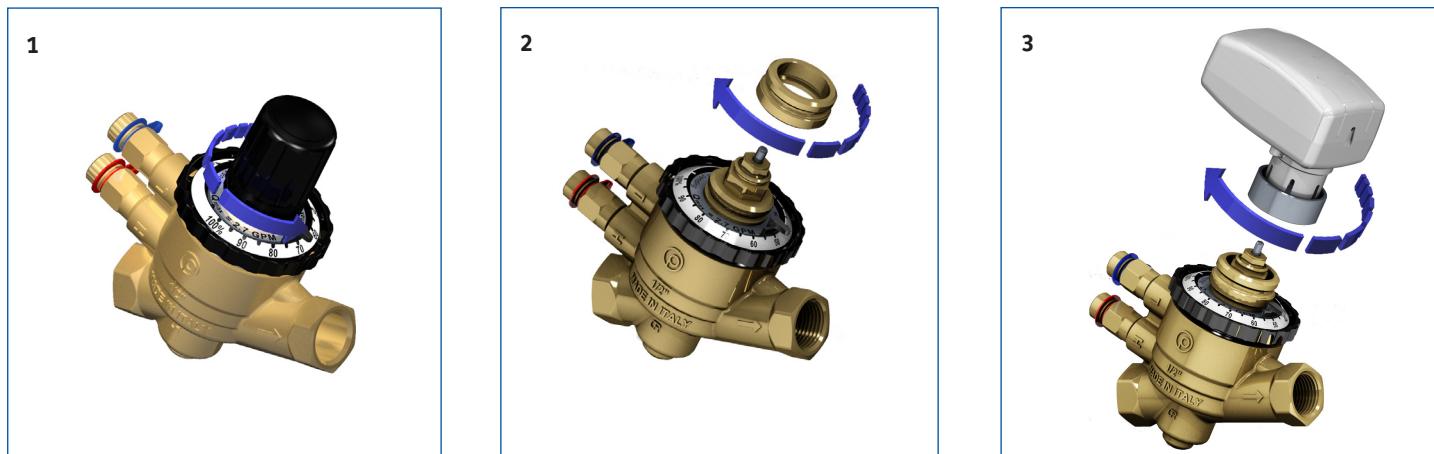

## ■ Actuator Assembly

### Axial VP1000 (DN15 – DN32) with VA-748x Electric Actuators

The axial VP1000 (DN15 to DN32) valves are delivered with a brass adapter to assembly the VA-748x motorized actuators family, Two models are provided according to the size of the valve:

- OA7010 adapter for DN15 and DN20 valves
- OA748X adapter for DN25 and DN32 valves

The adapters are available as accessory in case the operator lost it.

### Axial VP1000 (DN15 – DN20) with VA-708x & VA-709x Thermal Actuators

The axial VP1000 (DN15 to DN20) only can be mounted on thermal actuators with an adpater that has to be ordered separately:

- VA-708x thermal actuators needs a different adapter VA64
- VA-709x thermal actuators needs a different adapter 0550390101

See also "Accessories" Table.

## Compact Axial VP1000 (DN15 – DN40) with VA-748x Electric Actuators

The compact VP1000 (DN15 to DN32) valves are delivered with a brass adapter to assembly the VA-748x motorized actuators family, at the exception of the DN40 valve where the adapter is delivered with the actuator.

Two models are provided according to the size of the valve:

- OA7010 adapter for DN15 and DN20 valves
- OA748X adapter for DN25 and DN32 valves
- VA93 adpater for DN40 valves

The adapters are available as accessory in case the operator lost it.

## Actuator Adjustment

After the maximum Flow Adjustment (See Paragr. 3) a calibration of the actuator is necessary to adapt the input signal to the new valve rotation.

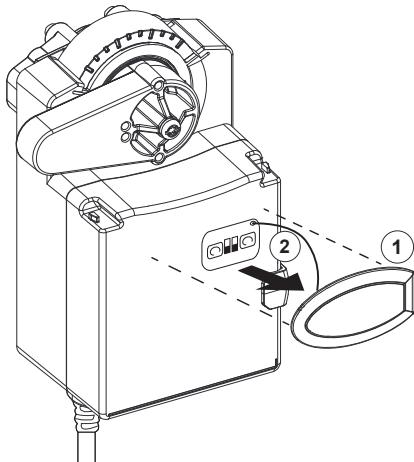

## For the calibration of the VA9310 proceed as follow:

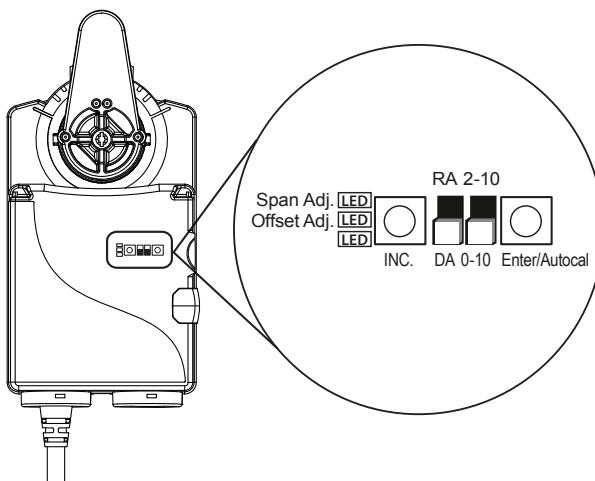

The Calibration function enables the actuator to redefine the selected input signal range proportionally across a reduced rotation range. The actuator maintains calibration when power is lost or removed.

Locate the oval cover on the front of the unit and pull the cover outward. See figure below for viewing the DIP switches and LEDs meaning.

With power applied to the actuator, press **Enter/Autocal** until all three LEDs are on.

**Remove the oval cover**

**DIP Switches and LEDs Placement**

The actuator begins rotating until the end-stops are found. When the actuator reaches the starting position and stops it's calibrated and ready to work.

## For the calibration of the VA9208 proceed as follow:

The CAL function enables the actuator to redefine the selected input signal range proportionally across a reduced rotation range. The actuator maintains calibration when power is lost or removed.

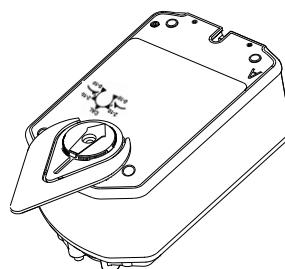

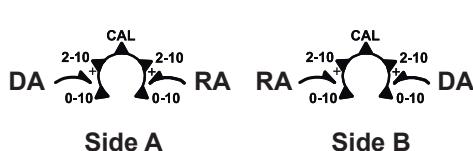

Follow these steps to calibrate the input signal range:

1. With power applied to the actuator, move the mode selection switch to the CAL position and leave it in this position for approximately 5 seconds. The actuator begins rotating until the end-stops are found.
2. Move the mode selection switch to the desired input signal range. Selection can be made while the calibration process is in progress, or after it is complete. The selected input signal is proportionally reconfigured to the reduced rotation range.

**Note:** During normal operation, if the actuator stroke increases due to seal or seat wear, input signals are automatically reconfigured to the increased rotation range in approximately 0.5° increments.

**Note:** If the actuator mounting position is changed or if the linkage is adjusted, repeat Step 1 and Step 2 to repeat the CAL function.

The mode selection switch must remain out of the CAL position for at least 2 seconds before re-initiating the CAL function. If the mode selection switch is left in the CAL position, the actuator defaults to 0-10 V input signal range, DA.

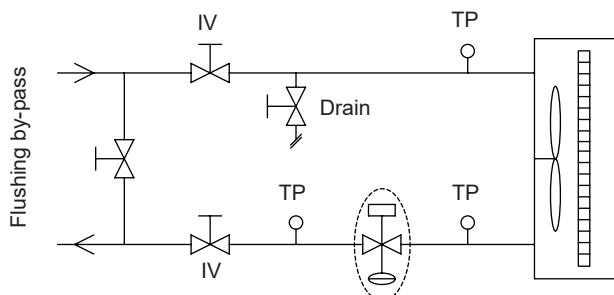

# Applications Examples

## ■ Systems with variable thermal power

The use of a motorised control valve that automatically limits the flow rate, ensures stable energy supply, independently from the available pressures and, at the same time, thanks to the possibility of controlling the flow rate regulator, it allows effective adjustment of ambient temperature.

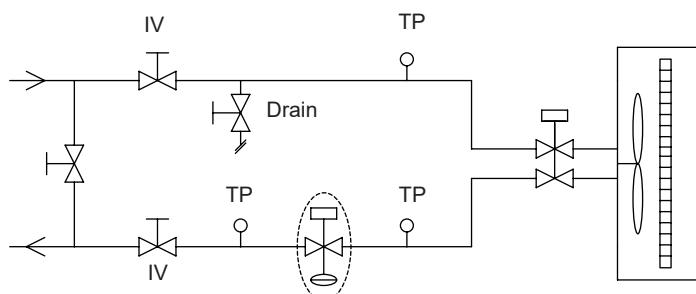

PICV is used as a constant flow limiter and control valve.

## ■ Systems with constant thermal power

If the valve is used to adjust fan-coil flow, it ensures the required flow rate to the equipment and it favours the hydraulic balance of the system. The exchanger always works in the best conditions possible with any differential pressure and the system is split into hydraulically separated areas.

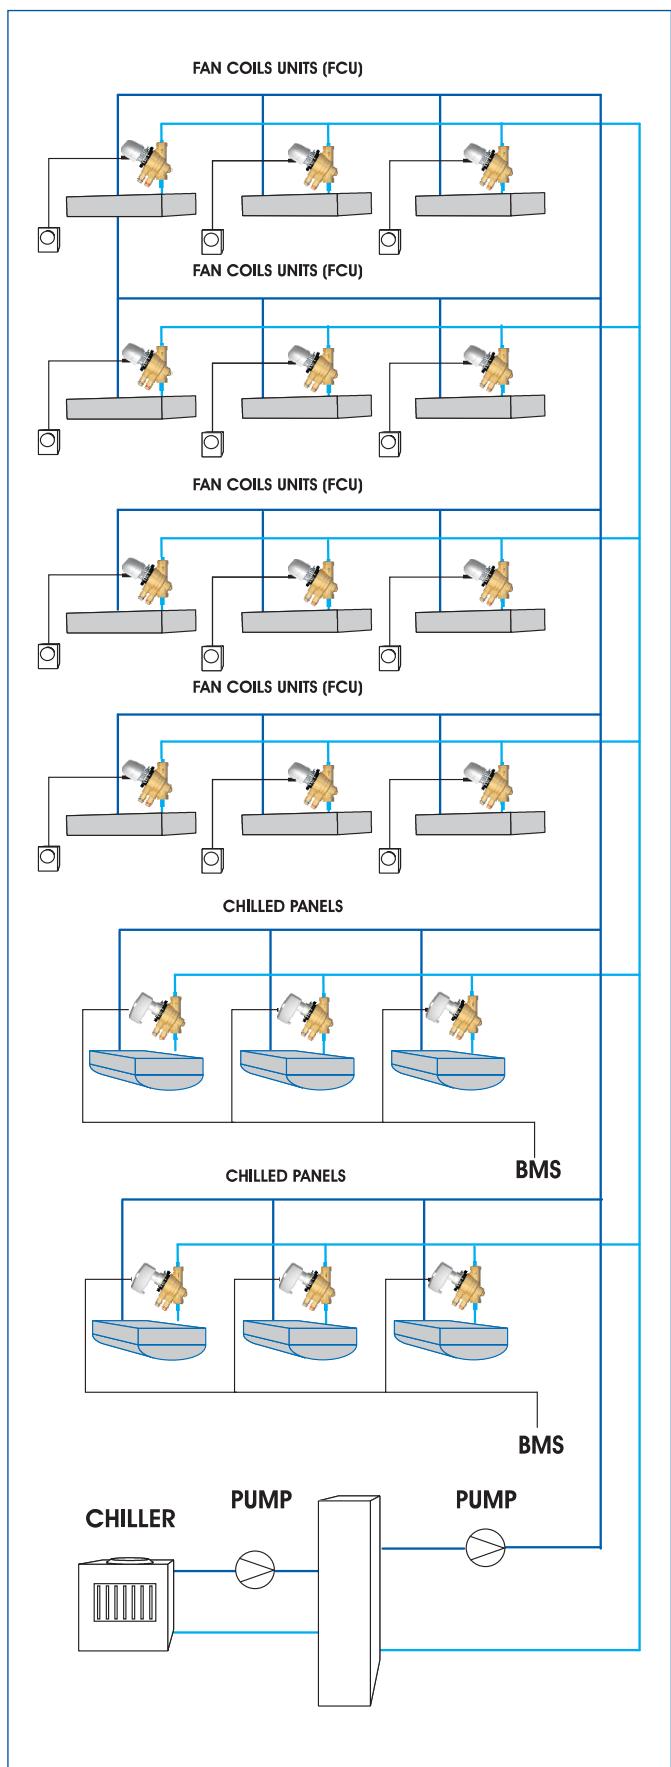

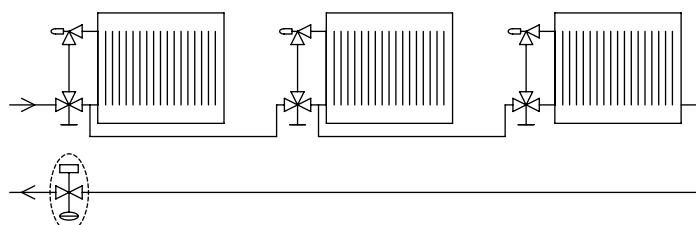

PICV is used as a constant flow limiter.

## ■ Single-pipe heating systems

An automatic valve placed on the system return line ensures a stable flow rate on the main branches at any thermostatic valve opening, thus reducing the possible sudden changes due to pressure variations in the system.

PICV is used as a constant flow limiter.

## Flow setting accuracy

## Ordering Codes

\* On the DN40 and DN50 ball valves, the pressure port are always included despite the Codes VP101xxx

## Valve - Actuators Combinations (VP1000 Axial only)

The VP1000 valve can be used with the VA-708x Thermal On-Off and VA-748x electronic modulating actuators.

### VA-708x Thermal Actuator

Product Codes	Power Supply	Control Type	Factory Setting	Valve Series
VA-7081-21	24 VAC/VDC	On/Off or DAT	Normally Closed (stem retracts when energized) 2 m cable length	VP10xAAA VP10xAAE VP10xAAG VP10xBAJ VP10xBAN VP10xHAA VP10xHDA VP10xHDC VP10xJAJ VP10xJDB
VA-7081-23	230 VAC			
VA-7080-21	24 VAC/VDC	On/Off or DAT	Normally Open (stem extends when energized) 2 m cable length	VP10xAAA VP10xAAE VP10xAAG VP10xBAJ VP10xBAN VP10xHAA VP10xHDA VP10xHDC VP10xJAJ VP10xJDB
VA-7080-23	230 VAC			

See "VA-708x" Product Bulletin for more information.

### VA-709x Thermal Actuator

Product Codes	Power Supply	Control Type	Factory Setting	Valve Series
VA-7090-21	24 VAC	Proportional	Normally Open (stem extends when energized) 2 m cable length	VP10xAAA VP10xAAE VP10xAAG VP10xBAJ VP10xBAN VP10xHAA VP10xHDA VP10xHDC VP10xJAJ VP10xJDB

See "VA-709x" Product Bulletin for more information.

## VA-748x Motorized Actuator

Product Codes	Power Supply	Control Type	Factory Setting	Valve Series
VA-7483-8201	24V AC/DC	Proportional Auto Stroke Detection with Feedback	Field Configurable	VP10xAAA
VA-7483-8201-RA		Proportional Auto Stroke Detection		VP10xAAE
VA-7482-8201		Proportional Auto Stroke Detection with Feedback and Fail Safe		VP10xAAG
VA-7482-8201-RA				VP10xBAJ
VA-7484-8001				VP10xBAN
VA-7484-8001-RA				VP100CAU
VA-7480-0001				VP100CAW
VA-7481-0001				VP100DAW
VA-7480-0003		Floating		VP100DAY
VA-7481-0003	230 VAC		---	VP10xHAA VP10xHDA VP10xHDC VP10xJAJ VP10xJDB VP10xKDD VP10xKDE VP100LDF
VA-7482-3001	24 VAC/DC	Proportional	Field Configurable	VP100CAU
VA-7482-3001-RA				VP100CAW VP100DAW VP100DAY
VA-7493-8201-RA	24VAC/DC	Proportional	Field Configurable	VP100MBC

See "VA-748x" Product Bulletin for more information.

## Valves-Rotary Actuators Optional Assembly Codes (VP1000 Ball Valves only)

Valve and actuator could be assembled in factory. This option has to be evaluated with JC sales representative.  
 Code of the assembly is obtained by adding an actuator suffix to the valve code. Actuator suffix identifies the type of actuator.  
 Example: non spring return actuator mounted on VP101EBC ball valve. Item code of the assembly is VP101EBC+510HGA

Actuator Suffix	Description
+510HGA*	VA9310-HGA-1, 10 Nm, Non Spring Return Actuator, 24 V AC/DC, Proportional Control
+538GGA	VA9208-GGA-1, 8 Nm, Spring Return Actuator, 24 V AC/DC, Proportional Control, assembled in Spring Open Valve configuration.
+538GGC	VA9208-GGC-1, 8 Nm, Spring Return Actuator, 24 V AC/DC, Proportional Control, two auxiliary switches, assembled in Spring Open Valve configuration.
+558GGA	VA9208-GGA-1, 8 Nm, Spring Return Actuator, 24 V AC/DC, Proportional Control, assembled in Spring Close Valve configuration.
+558GGC	VA9208-GGC-1, 8 Nm, Spring Return Actuator, 24 V AC/DC, Proportional Control, two auxiliary switches, assembled in Spring Close Valve configuration.

**Note:** \*Auxiliary switches available as kit. See Product Bulletin of VA9310 for more details.

## Accessories

General Accessories		Picture (indicatively)
Codes	Description	
<b>VA64</b>	Adapter for VA-708x actuator	
<b>0550390101</b>	Adapter for VA-709x actuator	
<b>0A7010</b>	Adapter for VA-748x actuator when used with DN15/DN20 valves	
<b>0A748X</b>	Adapter for VA-748x actuator when used with DN25/DN32 valves	
<b>VA93</b>	Adapter for VA-7493 actuator when used with compact DN40 valve	
<b>T90</b>	Pressure Plug (quantity 2)	
<b>VP1DM</b>	Digital differential pressure manometer kit	
Compact Valve Series Accessories		
<b>INSL-01</b>	Insulation kit for DN15 valves (VP10xHxx)	
<b>INSL-03</b>	Insulation kit for DN20 valves (VP10xJxx)	
<b>INSL-05</b>	Insulation kit for DN25 valves (VP10xKxx)	
<b>REPLCRT-HAA</b>	Cartdrige replacement for VP10xHAA valve	
<b>REPLCRT-HDA</b>	Cartdrige replacement for VP10xHDA valve	
<b>REPLCRT-JAJ</b>	Cartdrige replacement for VP10xJAJ valve	
<b>REPLCRT-JDB</b>	Cartdrige replacement for VP10xJDB valve	
Ball Valve Series Accessories		
<b>B90T</b>	2x union nuts with O-rings for VP1000 ball valve DN40	
<b>B91</b>	2x union nuts with O-rings for VP1000 ball valve DN50	

## After Installation (VP1000 Axial only)

The VP1000 is delivered with a carton tag where the installer can note all the characteristics of the valve (Date, Presetting, Project, other).

The valve tag is water resistant and is made of innovative material to prevent any damage in the field.

Johnson Controls does not accept any liability for improper or wrong use of this product.

Always protect the pressure regulator by using strainers upstream of the valve and, in any case, make sure water quality complies with EN8065 standards (Fe < 0.5 mg/kg and Cu < 0.1 mg/kg).

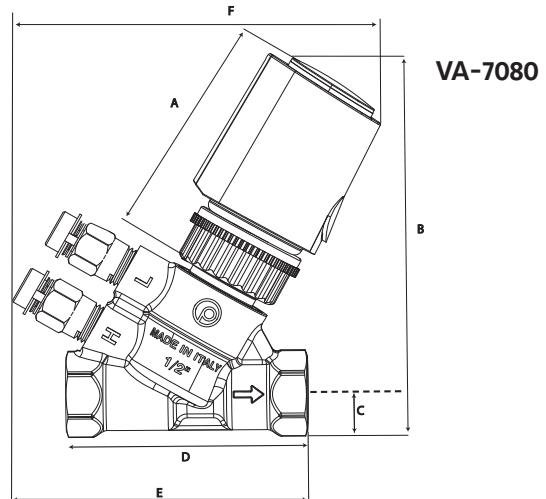

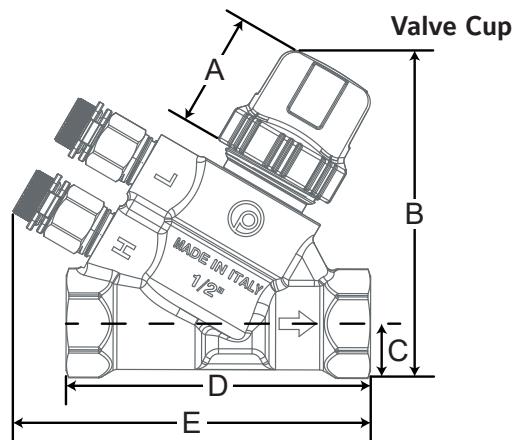

Furthermore, maximum iron oxide in the water passing through this product should not exceed 25 mg/kg (25 ppm).

To ensure the main pipework is cleaned appropriately, flushing by-passed should be used without flushing through the pressure regulator or the PICV thereby preventing debris that might clog the valve.

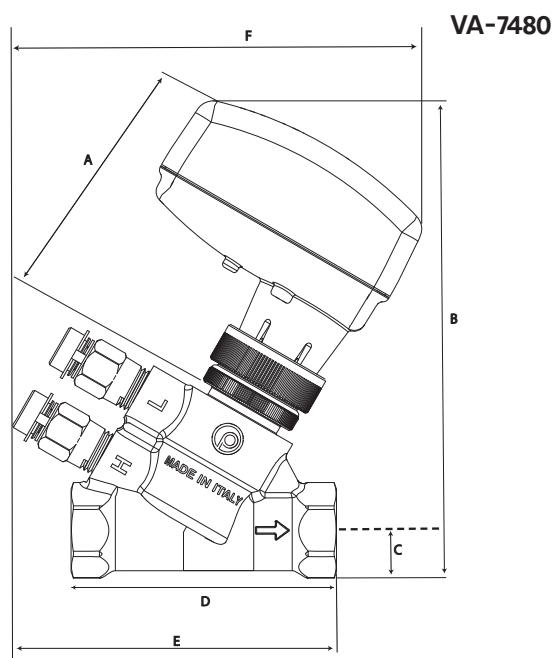

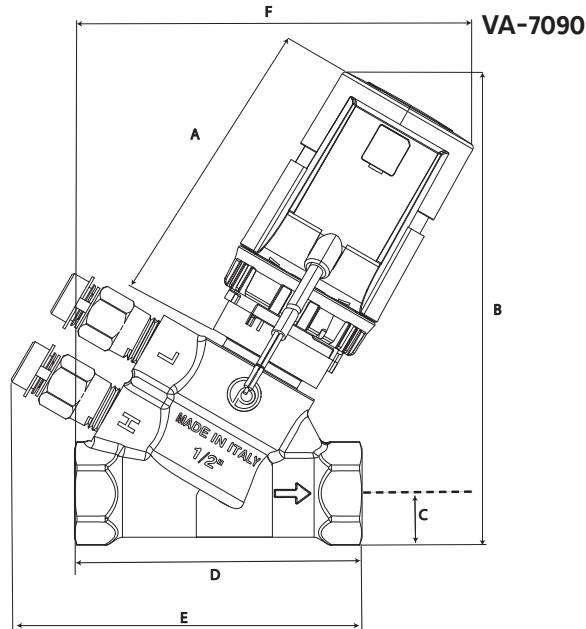

## Dimensions (mm)

### ■ Compact Axial DN15 - DN20
